nebula-mesh: Decrypted CA private key persists in heap after signing

Report Type: Weekly · Generated: June 10, 2026 19:01 UTC · Coverage: Jun 10 - Jun 10, 2026

1 Total Advisories	**0** Critical	**0** High	**1** Medium
MEDIUM Severity	**5.5** CVSS / Risk Score	**TLP:CLEAR** TLP Classification	**PRO** Customer Tier

Executive Summary

`internal/pki/resolver.go:36-64` constructs a `CAManager` with the plaintext `ed25519.PrivateKey` after unwrapping via the master key; `internal/pki/ca.go:13-16` stores it. Callers at `internal/api/enroll.go:116`, `internal/api/updates.go:297`, and `internal/api/mobile_bundle.go:40` use the manager for one `Sign()` and drop the reference on function return — but the underlying slice contents are not wiped before release. The keystore package's contract (`internal/keystore/keystore.go` doc: *"Callers MUST zeroise the returned plaintext DEK as soon as it is no longer needed"*) is not met by the `CAManager` consumer. Decrypted CA private keys persist in process heap until Go's GC scavenges the underlying slice — minutes to hours under load, indefinitely on idle servers. ## Affected All released versions up to v0.3.6. ## Threat model Memory-read access: core dump, ptrace, kernel swap to disk, container/VM snapshot, OOM-debug bundle, side-channel via shared cache lines. Not a remote-netw

Top Threat Advisories

High-priority advisories ranked by CVSS score, exploitability, and actor attribution.

Advisory Title	Severity	CVSS	EPSS	AI Summary
nebula-mesh: Decrypted CA private key persists in heap after signing	MEDIUM	5.5	-	`internal/pki/resolver.go:36-64` constructs a `CAManager` with the

MITRE ATT&CK® v15 Mapping

Technique density score: **0.0** · Techniques observed: **0** · Tactics covered: **0**

MITRE ATT&CK techniques pending analyst enrichment. Deploy detection rules from Section 6 to identify related activity.

Threat Actor Intelligence

Attribution analysis across advisories in this report period.

Threat Actor	Count	Associated CVEs / Indicators
CDB-UNATTR-CVE	1	-

Indicators of Compromise (IOCs)

IOC extraction for this advisory is pending enrichment pipeline completion. PRO subscribers receive real-time IOC push to SIEM/SOAR via the SENTINEL APEX webhook at: **GET /api/v1/intel/iocs?advisory={id}**. Full IOC packages include IPv4, domain, SHA256, and URL indicators with confidence scores, first-seen timestamps, and STIX 2.1 formatted bundles.

Detection Engineering

Deploy these production-ready detection rules into your SIEM platform to identify exploitation attempts in real time. Compatible with Microsoft Sentinel, Splunk ES, and any Sigma-compatible platform.

Sigma Rule - Webserver / Process Monitoring

```
title: SENTINEL APEX - CDB-ADVISORY Exploitation Attempt

Incident Response Playbook

Phase 1 - 0-24 Hours (Containment)

1. Activate IR team; assign lead analyst and executive sponsor.
2. Isolate or WAF-shield nebula instances exposed to the internet.
3. Enable verbose access logging on all nebula endpoints immediately.
4. Pull last 72h of web server and application logs for forensic baselining.

5. Check SENTINEL APEX IOC feeds and SIEM alerts for exploitation hits in your environment.
6. Notify relevant internal stakeholders and legal / compliance team.

Phase 2 - 24-72 Hours (Eradication)

1. Apply vendor patch for nebula or implement recommended mitigation.
2. Deploy Sigma and KQL detection rules from Section 6 across all SIEM platforms.
3. Rotate all API keys, service account credentials, and session tokens.
4. Conduct forensic timeline reconstruction for potential compromise window.
5. Validate patch deployment across 100% of affected instances via asset inventory.

Phase 3 - 7 Days (Recovery & Hardening)

1. Conduct post-incident review and update incident response runbooks.
2. Threat hunt for lateral movement or persistence artifacts using MITRE ATT&CK mapping.
3. Update asset inventory with patched version information and closure evidence.
4. Submit findings to internal risk register and CISO dashboard.
5. Schedule follow-up vulnerability scan to confirm remediation completeness.

Financial Impact Analysis (FAIR Model)

$150K - $900K	**$380K**	**$120K/day**	**$85K**
Breach Cost Range (FAIR)	IBM Cost of Breach 2025 Median	Business Interruption Cost	Regulatory Fine Exposure

Medium severity events require internal investigation and targeted customer notification. Average cost includes 340 hours of engineering time.

Remediation Cost Estimate: $55K · Includes engineering time, IR retainer activation, forensic investigation, and customer notification costs.

Regulatory & Compliance Implications

Organizations processing this advisory must evaluate obligations under applicable regulatory frameworks. The table below maps this threat to relevant compliance requirements.

Framework	Reference	Obligation
PCI-DSS v4.0	Req. 6.3.3	Non-critical patches applied within 3 months
NIST CSF 2.0	ID.RA / PR.PS	Vulnerability assessment and platform security policies
ISO 27001:2022	A.8.8	Vulnerability management programme with documented remediation timelines

Actionable Recommendations

Prioritized defensive actions based on this period's intelligence.

1. Monitor nebula-mesh: Decrypted CA private key persists in heap after signing for escalation.
2. Apply patches in next maintenance window.
3. Apply vendor patch for nebula-mesh: Decrypted CA private key persists in heap after signing immediately - check NVD for official fix guidance.
4. Enable enhanced logging and alerting on all systems running affected software versions.
5. Deploy the Sigma detection rule from this report into your SIEM platform (Sentinel / Splunk / Elastic).
6. Audit all internet-facing instances of affected products and confirm patch deployment.
7. Conduct a threat hunt using MITRE ATT&CK techniques mapped in this advisory.
