Executive Summary

Summary `JWSVerifier::getAlgorithm()` in `src/Library/Signature/JWSVerifier.php` (line 144) merges protected and unprotected headers using PHP's spread operator: ``php \$completeHeader = [...\$signature->getProtectedHeader(), ...\$signature->getHeader()];`` In PHP, when spreading arrays with duplicate string keys, the **last array's values take precedence**. Since the unprotected header (`getHeader()`) is spread second, an attacker can override the integrity-protected `alg` parameter by placing a different value in the unprotected header. This creates a Time-of-Check/Time-of-Use (TOCTOU) vulnerability: 1. `HeaderCheckerManager` validates `alg` from the **protected** header 2. `JWSVerifier` uses `alg` from the **unprotected** header for actual verification The same issue exists in `JWEDecrypter.php` (lines 120-124) where `array\_merge()` exhibits the same last-wins behavior for `alg` and `enc`. ## Affected Code **JWSVerifier.php line 144** — Spread operator merge order allows u

Indicators of Compromise (IOCs)

IOC extraction for this advisory is pending enrichment pipeline completion. PRO subscribers receive real-time IOC push to SIEM/SOAR via the SENTINEL APEX webhook at: **GET /api/v1/intell/iocs?advisory={id}**. Full IOC packages include IPv4, domain, SHA256, and URL indicators with confidence scores, first-seen timestamps, and STIX 2.1 formatted bundles.

Detection Engineering

Deploy these production-ready detection rules into your SIEM platform to identify exploitation attempts in real time. Compatible with Microsoft Sentinel, Splunk ES, and any Sigma-compatible platform.

Incident Response Playbook

Phase 1 - 0-24 Hours (Containment)

1. Activate IR team; assign lead analyst and executive sponsor.
2. Isolate or WAF-shield PHP JWT Framework: JWSVerifier uses algorithm from unprotected header, enabling algorithm confusion attacks instances exposed to the internet.

- 3. Enable verbose access logging on all PHP JWT Framework: JWSVerifier uses algorithm from unprotected header, enabling algorithm confusion attacks endpoints immediately.
- 4. Pull last 72h of web server and application logs for forensic baselining.
- 5. Check SENTINEL APEX IOC feeds and SIEM alerts for exploitation hits in your environment.
- 6. Notify relevant internal stakeholders and legal / compliance team.

Phase 2 - 24-72 Hours (Eradication)

- 1. Apply vendor patch for PHP JWT Framework: JWSVerifier uses algorithm from unprotected header, enabling algorithm confusion attacks or implement recommended mitigation.
- 2. Deploy Sigma and KQL detection rules from Section 6 across all SIEM platforms.
- 3. Rotate all API keys, service account credentials, and session tokens.
- 4. Conduct forensic timeline reconstruction for potential compromise window.
- 5. Validate patch deployment across 100% of affected instances via asset inventory.

Phase 3 - 7 Days (Recovery & Hardening)

- 1. Conduct post-incident review and update incident response runbooks.
- 2. Threat hunt for lateral movement or persistence artifacts using MITRE ATT&CK mapping.
- 3. Update asset inventory with patched version information and closure evidence.
- 4. Submit findings to internal risk register and CISO dashboard.
- 5. Schedule follow-up vulnerability scan to confirm remediation completeness.

Financial Impact Analysis (FAIR Model)

\$800K - \$4.5M Breach Cost Range (FAIR)	\$1.8M IBM Cost of Breach 2025 Median	\$450K/day Business Interruption Cost	\$320K Regulatory Fine Exposure
---	--	--	--

High severity incidents activate IR retainers, forensic investigation (avg 47 days), and reputational damage impacting 12-18% of revenue.

Remediation Cost Estimate: \$180K · Includes engineering time, IR retainer activation, forensic investigation, and customer notification costs.

Regulatory & Compliance Implications

Organizations processing this advisory must evaluate obligations under applicable regulatory frameworks. The table below maps this threat to relevant compliance requirements.

Framework	Reference	Obligation
GDPR	Art. 32 / Art. 33	Appropriate technical measures; notify DPA if personal data affected

Framework	Reference	Obligation
PCI-DSS v4.0	Req. 6.3.3	Patches within 1 month; documented risk acceptance if deferred
NIS2 Directive	Art. 21	Risk management measures including vulnerability handling policies
NIST CSF 2.0	RS.MI / RC.RP	Incident mitigation and recovery planning; post-incident review

Actionable Recommendations

Prioritized defensive actions based on this period's intelligence.

1. Apply patches immediately for PHP JWT Framework: JWSVerifier uses algorithm from unprotected header, enabling algorithm confusion attacks.
2. Enable enhanced monitoring for related IOCs.
3. Review SIEM rules for associated MITRE ATT&CK techniques.
4. Apply vendor patch for PHP JWT Framework: JWSVerifier uses algorithm from unprotected header, enabling algorithm confusion attacks immediately - check NVD for official fix guidance.
5. Enable enhanced logging and alerting on all systems running affected software versions.
6. Deploy the Sigma detection rule from this report into your SIEM platform (Sentinel / Splunk / Elastic).
7. Audit all internet-facing instances of affected products and confirm patch deployment.
