

Pillow: Out-of-bounds read via attacker-controlled row stride on Pillow's mmap path (Mcldas AREA files)

Report Type: Weekly · Generated: July 20, 2026 21:27 UTC · Coverage: Jul 20 - Jul 20, 2026

1 Total Advisories	0 Critical	1 High	0 Medium
HIGH Severity	7.5 CVSS / Risk Score	TLP:CLEAR TLP Classification	PRO Customer Tier

Executive Summary

Summary When Pillow loads an uncompressed image whose tile uses the `raw` codec and a mode in `Image.\_MAPMODES`, and the image was opened **from a filename**, it memory-maps the file and builds the image's row pointers directly into the mapping via `Pymaging\_MapBuffer` (`src/map.c`). The per-row spacing (`stride`) is taken from the tile arguments. `map.c` validates `offset + ysize\*stride <= buffer\_len` but **never checks that `stride` is at least the natural row width `xsize \* pixelsize`**. The **Mcldas** AREA plugin (`McldasImagePlugin.py`) derives `stride`, `offset`, `xsize`, and `ysize` directly from attacker-controlled 32-bit header words with no validation. By supplying a `stride` far smaller than the row width, an attacker makes each row pointer read `xsize\*pixelsize` bytes that run past the mapped region. Accessing the pixels (e.g. `Image.tobytes()`, `getpixel`, `convert`, `save`) then reads adjacent process memory (information disclosure) or faults (SIGBUS, denial of serv

Top Threat Advisories

High-priority advisories ranked by CVSS score, exploitability, and actor attribution.

Advisory Title	Severity	CVSS	EPSS	AI Summary
Pillow: Out-of-bounds read via attacker-controlled row stride on Pillow 7.5	Critical	9.8	38.0%	## Summary When Pillow loads an uncompressed image whose tile uses the 'r'

MITRE ATT&CK® v15 Mapping

Technique density score: 0.0 · Techniques observed: 0 · Tactics covered: 0

MITRE ATT&CK techniques pending analyst enrichment. Deploy detection rules from Section 6 to identify related activity.

Threat Actor Intelligence

Attribution analysis across advisories in this report period.

Threat Actor	Count	Associated CVEs / Indicators
CDB-UNATTR-CVE	1	-

Indicators of Compromise (IOCs)

IOC extraction for this advisory is pending enrichment pipeline completion. PRO subscribers receive real-time IOC push to SIEM/SOAR via the SENTINEL APEX webhook at: **GET /api/v1/intel/iocs?advisory={id}**. Full IOC packages include IPv4, domain, SHA256, and URL indicators with confidence scores, first-seen timestamps, and STIX 2.1 formatted bundles.

Detection Engineering

Deploy these production-ready detection rules into your SIEM platform to identify exploitation attempts in real time. Compatible with Microsoft Sentinel, Splunk ES, and any Sigma-compatible platform.

Sigma Rule - Webserver / Process Monitoring

```
title: SENTINEL APEX - Heap Overflow Exploitation Attempt
id: cdb-cdb-advisory-det
status: experimental
description: |
  Detects exploitation attempts targeting CDB-ADVISORY (heap-based overflow).
  Monitors for anomalous process crashes and memory allocation failures.

Incident Response Playbook

Phase 1 - 0-24 Hours (Containment)

- 1. Activate IR team; assign lead analyst and executive sponsor.
- 2. Isolate or WAF-shield Pillow: Out instances exposed to the internet.
- 3. Enable verbose access logging on all Pillow: Out endpoints immediately.
- 4. Pull last 72h of web server and application logs for forensic baselining.
- 5. Check SENTINEL APEX IOC feeds and SIEM alerts for exploitation hits in your environment.
- 6. Notify relevant internal stakeholders and legal / compliance team.

Phase 2 - 24-72 Hours (Eradication)

- 1. Apply vendor patch for Pillow: Out or implement recommended mitigation.
- 2. Deploy Sigma and KQL detection rules from Section 6 across all SIEM platforms.
- 3. Rotate all API keys, service account credentials, and session tokens.
- 4. Conduct forensic timeline reconstruction for potential compromise window.
- 5. Validate patch deployment across 100% of affected instances via asset inventory.

Phase 3 - 7 Days (Recovery & Hardening)

- 1. Conduct post-incident review and update incident response runbooks.
- 2. Threat hunt for lateral movement or persistence artifacts using MITRE ATT&CK mapping.
- 3. Update asset inventory with patched version information and closure evidence.
- 4. Submit findings to internal risk register and CISO dashboard.
- 5. Schedule follow-up vulnerability scan to confirm remediation completeness.

Financial Impact Analysis (FAIR Model)

\$800K - \$4.5M Breach Cost Range (FAIR)	\$1.8M IBM Cost of Breach 2025 Median	\$450K/day Business Interruption Cost	\$320K Regulatory Fine Exposure
--	---	---	---

High severity incidents activate IR retainers, forensic investigation (avg 47 days), and reputational damage impacting 12-18% of revenue.

Remediation Cost Estimate: \$180K · Includes engineering time, IR retainer activation, forensic investigation, and customer notification costs.

Regulatory & Compliance Implications

Organizations processing this advisory must evaluate obligations under applicable regulatory frameworks. The table below maps this threat to relevant compliance requirements.

Framework	Reference	Obligation
GDPR	Art. 32 / Art. 33	Appropriate technical measures; notify DPA if personal data affected
PCI-DSS v4.0	Req. 6.3.3	Patches within 1 month; documented risk acceptance if deferred
NIS2 Directive	Art. 21	Risk management measures including vulnerability handling policies
NIST CSF 2.0	RS.MI / RC.RP	Incident mitigation and recovery planning; post-incident review

Actionable Recommendations

Prioritized defensive actions based on this period's intelligence.

1. Apply patches immediately for Pillow: Out-of-bounds read via attacker-controlled row stride on Pillow's mmap path (MclDas AREA files).
2. Enable enhanced monitoring for related IOCs.
3. Review SIEM rules for associated MITRE ATT&CK techniques.
4. Apply vendor patch for Pillow: Out-of-bounds read via attacker-controlled row stride on Pillow's mmap path (MclDas AREA files) immediately - check NVD for official fix guidance.
5. Enable enhanced logging and alerting on all systems running affected software versions.
6. Deploy the Sigma detection rule from this report into your SIEM platform (Sentinel / Splunk / Elastic).
7. Audit all internet-facing instances of affected products and confirm patch deployment.
